

Russula graminea, a new green species from Fennoscandia

JUKKA VAURAS, JUHANI RUOTSALAINEN and KARE LIIMATAINEN

VAURAS, J., RUOTSALAINEN, J. & LIIMATAINEN, K. 2012: Russula graminea, a new green species from Fennoscandia. – Karstenia 52:51–57. HELSINKI. ISSN 0453-3402.

Russula graminea, a new species occurring with *Picea abies*, is described and illustrated. It is known from Finland, Sweden and Norway, from southern to northern boreal zone. This rare species is distinct by the following characters: fruit bodies fairly large and robust, pileus markedly olive-green, often with yellow spots, lamellae pale yellow, mild to acrid when young, later mild, stipe white, and spores in mass ochre (IIIa–IVa).

Key words: Russulales, *Picea abies*, *Russula graminea*, Fennoscandia, taxonomy

Introduction

In earlier papers we have dealt with some northern species of *Russula*, characterized by green pileus, or at least often green shades, namely *Russula olivina* Ruots. & Vauras and *R. postiana* Romell (Ruotsalainen & Vauras 1990), *R. pubescens* A. Blytt (Ruotsalainen & Vauras 1991), *R. olivobrunnea* Ruots. & Vauras and *R. groenlandica* Ruots. & Vauras (Ruotsalainen & Vauras 1994), *R. violaceoincarnata* Knudsen & T.Borgen (Ruotsalainen & Vauras 1995), *R. fulvograminea* Ruots., Sarnari & Vauras (Ruotsalainen, Sarnari & Vauras 1997)). For a longer time we have been aware of a new species, which is described here as *Russula graminea*, honouring the provisional name used by Tauno Ulvinen (Herbarium of Oulu University, Finland) for his collection from the type locality in 1977 together with Risto Tuomikoski and Mauri

Korhonen. Recently, the species was included in *Funga Nordica* (Knudsen et al. 2012). It has also been presented in the book of Marstad (2004).

Material and methods

The colours of fresh specimens were compared with those in Küppers (1981). Spore masses from spore prints were placed between microscope slides and colours were determined as Romagnesi's codes against the colour chart prepared by Christian Dagron. The measurements of the spores were made excluding ornamentation, and basidial lengths excluding sterigmata. The spores were measured in Melzer's reagent, other elements in 10 % ammonium-hydroxide. The averages of the spores and basidia are given as underlined, and 5 % from each end of their range in parentheses.

Molecular analyses. DNA was extracted from a few milligrams of dried material (a piece of lamella) with the NucleoSpin plant kit (Macherey-Nagel, Düren, Germany). Primers ITS 1F and ITS 4 (White et al. 1990; Gardes &

Brunns 1993) were used to amplify ITS regions. The same primer pairs were used in direct sequencing. PCR amplification and sequencing followed Niskanen et al. (2009). Sequences were assembled and edited with Sequencher 4.1 (Gene Codes, Ann Arbor, Mich., USA). A total of three new ITS sequences of *R. graminea* were produced for this study.

Russula graminea Ruots., H.Unger & Vauras, sp. nova – Figs. 1–4
MycoBank no.: MB 802595

Species media vel grandis, robusta. Pileo 4–15 cm lato, pulchre viride, saepe cum maculis viridi-flavis, raro centro rufo-brunneo. Lamellis cremeis, dein subflavis, sapore potius acri, aetate miti. Stipite 6–20 cm longo, 1.5–4 cm crasso, albo, saepe subclavato. Carne alba, odore indistincto, sapore miti. Sporis in cumulo ochraceis, IIIa–IVa in codice Romagnesii, subglobosis, (8.3–)8.5–10.5(–11.0) × (7.0–)7.3–9.1(–9.5) µm, ornamenti nonnihil reticulatis, verrucis obtusis usque ad 1.5 µm altis, amyloideis. Basidiis 4-sporigeriis. Epicute pilis obtusis, 3–6 µm latis, dermatocystidiis cylindratis vel subclavaeformibus intermixtis, 4–11 µm latis. Habitatio: cum Piceis in silvis adultis, saepe in Sphagno.

Typus: Finland. Koillismaa. Kuusamo, Iivaara mountain, E slope, Isokorpi, mature fairly rich brookside forest with *Picea abies* and scattered *Betula pubescens* and *Alnus incana*, *Vaccinium myrtillus* abundant, Grid 27°E: 7303:623, alt. ca 350 m a.s.l., 19.VIII.1997 Ruotsalainen 4372F (KUO – holotypus; G, M, MICH, O, S, TUR-A – isotypi).

Etymology: *graminea* (Latin) refers to the green pileus of the species.

Pileus 4–15 cm in diam, at first convex, later expanded and depressed, when young and moist greenish yellow, soon bright olive green, often with yellow areas, exceptionally mixed with red to wine-red, centre green, greenish-yellow (S20Y90M00, S20Y99M00) to brown-green (S40Y80M10, S40Y60M10), at margin green (Y80M20C40, Y80M20C30) to pale yellowish-green (S20C00Y60), blunt, smooth for a long time, later slightly sulcate; surface when moist viscid, when dry mat, not pruinose, uneven, ca half of the pileipellis peeling. *Lamellae* up to

22 mm broad, at first cream white, later cream-yellow to pale yellow, with some bifurcations and some lamellulae. *Stipe* 6–20 × 1.5–4 cm, subclavate, longitudinally rugose, not pruinose, spongy inside, later hollow; at first white, later somewhat greyish and with brown patches at base. *Context* white, under pileipellis pale greyish green. *Odour* indistinct. *Taste* mild in context, fairly acrid to mild in young lamellae, later mild. *Spores* in mass ochre (Romagnesi IIIa–IVa), (8.3–)8.5–9.4–10.5(–11.0) × (7.0–)7.3–8.1–9.1(–9.5) µm, total range of mean values 8.9–9.8 × 7.6–8.6 µm, Q = 1.1–1.16–1.2(–1.3), total range of mean Q values 1.14–1.19 (120 spores from 6 collections); subglobose, amyloid, with partial reticulum, warts up to 1.5 µm high, blunt to aculeate, plage amyloid. *Basidia* 39–48–56 × 12–14–16 µm (n = 31), clavate, 4-spored. *Hymenial cystidia* 10–15 µm broad, blunt to apperidiculate. *Pileipellis: apical cells* 3–6 µm broad, cylindrical or tapering to apex, some with knobs, *dermatocystidia* 4–11 µm broad, 1–3 -septate, cylindrical to subclavate, without encrusted elements.

Distribution, ecology and phenology

Russula graminea has a wide distribution in Fennoscandia. In Finland it has a north-oriented distribution with occurrences mainly in middle and northern boreal zone. In Sweden the species has been collected only at the coast of Gulf of Bothnia, from southern and middle boreal zone, with several localities in Ångermanland. In Norway the southernmost localities are close to the limit of the hemiboreal (boreonemoral) zone.

R. graminea grows in fairly old forests of *Picea abies*, very often on slopes of hills, in paludified brooksites, in or close to *Sphagnum*. The species seems to be somewhat, but not strongly exacting. In the type locality, at the type site, following plants were listed growing near *R. graminea*:

Fig. 1 (Right up). *Russula graminea*, Paltamo, Saukkovaara, 24.VIII.2011 Ruotsalainen & Vauras 28360F (TUR-A). – Photo: J. Ruotsalainen.

Fig. 2 (Right down). *Russula graminea*, Posio, Noukavaara, 15.VIII.2010 Calledda et al. (TUR-A). – Photo: F. Calledda.

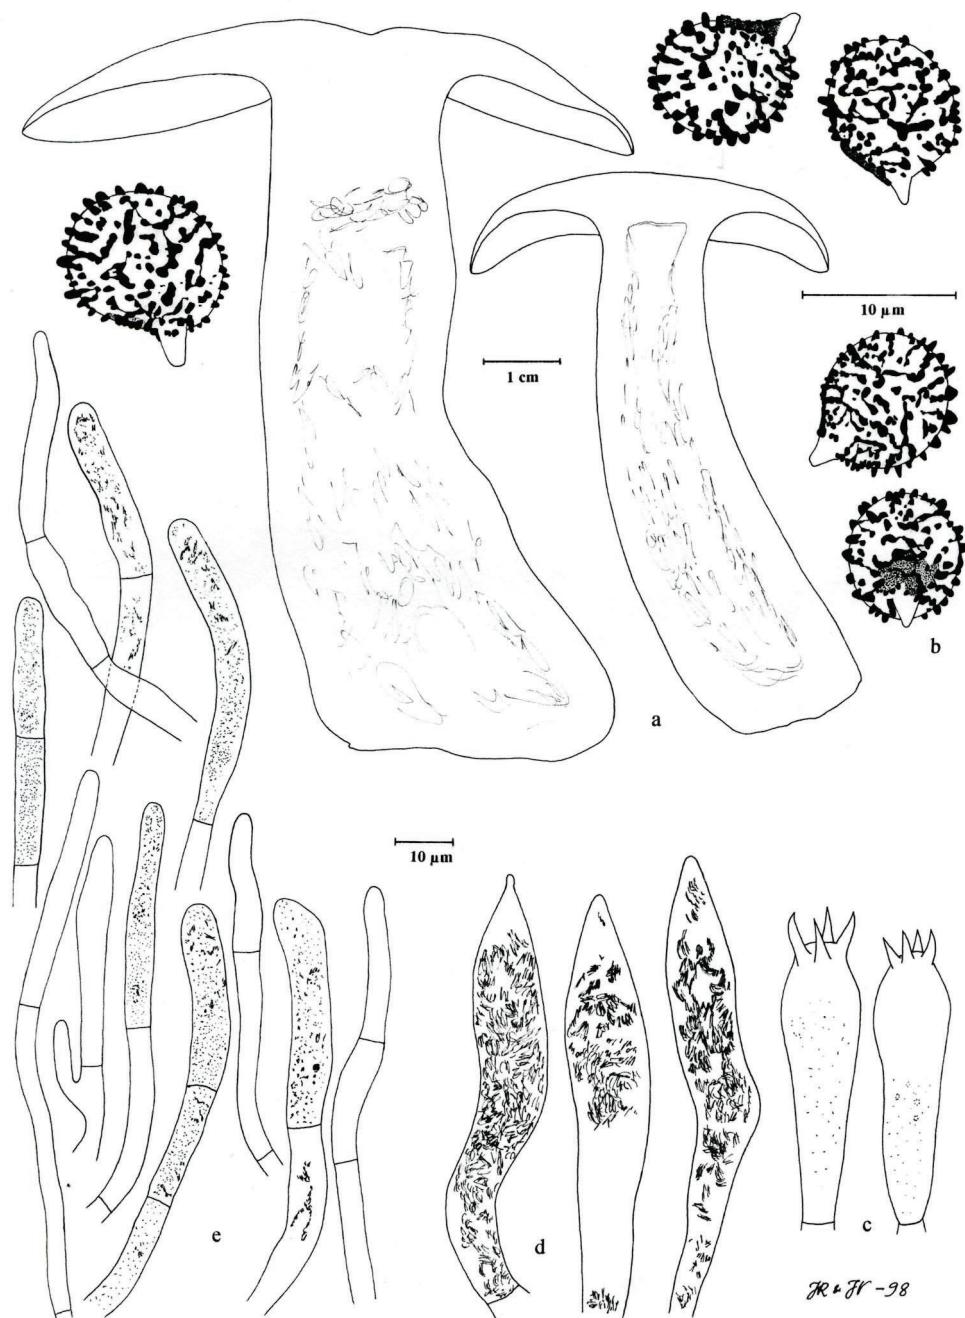

Fig. 3. Holotype of *Russula graminea*. Cross-sections of fruit bodies (a) and microscopical characters (b = spores, c = basidia, d = hymenial cystidia, e = elements of pileipellis).

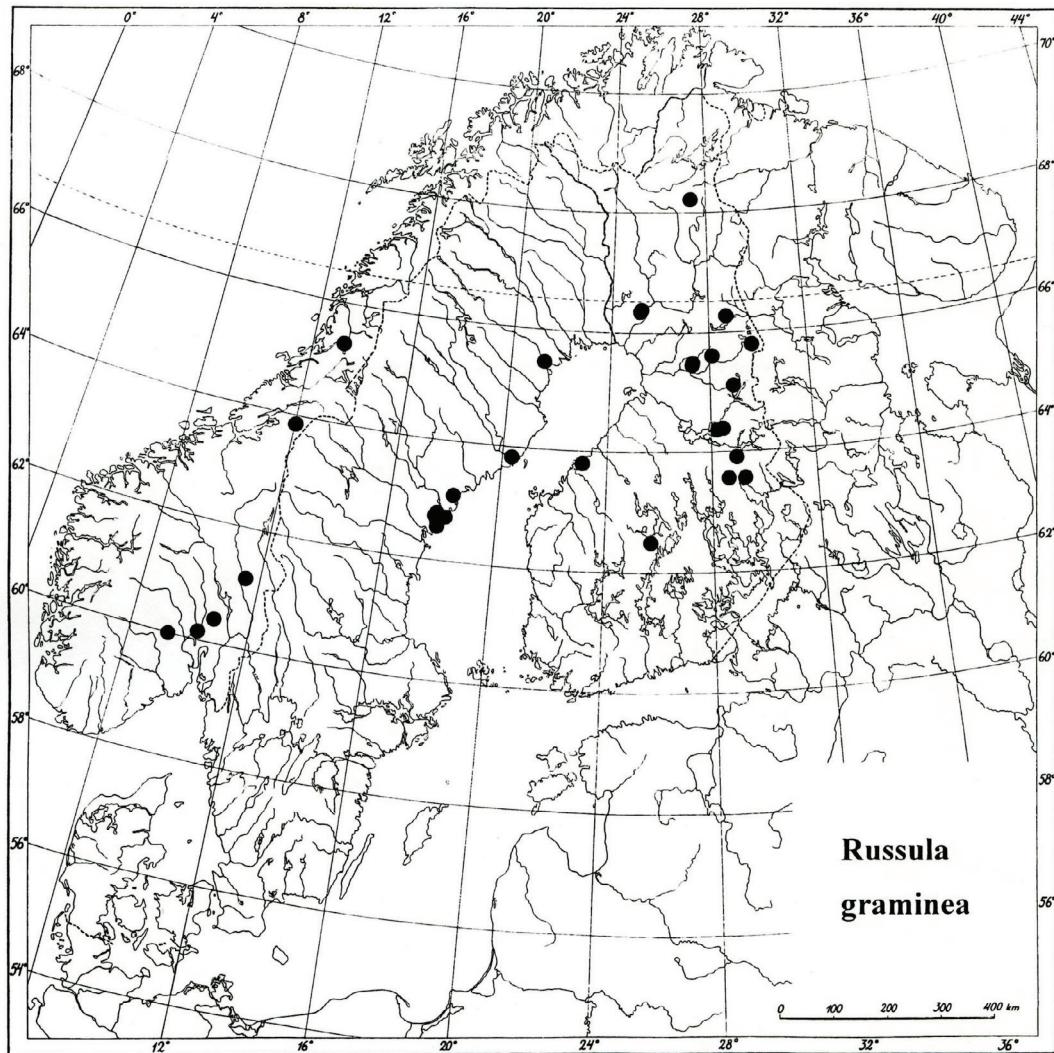

Fig. 4. Distribution of *Russula graminea* in Fennoscandia, according the material examined.

Vaccinium myrtillus, *Gymnocalypium dryopteris*, *Geranium sylvaticum*, *Trientalis europaea*, *Maianthemum bifolium*, *Cornus suecica*, *Lycopodium annotinum*, *Rubus saxatilis*, *Melica nutans*, *Coeloglossum viride*, *Orthilia secunda* and *Pleurozium schreberi*. Other fungi observed close to *R. graminea* include *Cortinarius evernius* (Fr.: Fr.) Fr., *Inocybe bufonia* Kokkonen & Vauras, *I. grammata* Quél., *Lactarius trivialis* (Fr.: Fr.) Fr., *Russula griseascens* (Bon & Gaugué) Marti and *R. taigarum* Ruots. & Vauras. It grows as small groups as a fairly rare species.

In Fennoscandia the fruiting period of *R. graminea* starts in mid-July, reaches the maximum in mid-August – late August, and ceases in mid-September.

Discussion

Russula graminea is an easy species to recognize already in the forest. It is a large *Russula*, like *R. paludosa* Britzelm. but with bright green pileus and white stipe. However, some features

are fairly variable, like taste and spore print colour. Rarely the pileus of *R. graminea* can attain wine-red colours. This has been documented by Hans-Gunnar Unger in Sweden, Ångermanland. In our material from Finland this feature has not been seen. But we observed once abundant red colour at margin of pileus of *Russula olivina*. In good weather situations fruit bodies of *Russula* can have more intensive colours than usually. It seems that red colour on green-capped species of *Russula* can occur under such conditions.

A species with fairly similar, but not so bright, pileus colour is *R. olivina*. Sometimes also *R. olivobrunnea* can have green colours on pileus. These two mild species grow also with *Picea abies*, but they have more slender fruit bodies and large spores with isolated warts. A third species, growing mainly with *Picea abies*, is *R. postiana*. This mild species has a matt pileus and stipe, lamellae are yellow to orange, spore deposit is yellow (IVd), and often stipe base has a smell of iodoform. A species closely related to *R. postiana*, *R. parolivascens* Bidaud & Moënne-Locc., has also been found in SW Finland (Varsinais-Suomi, Parainen, M. & P. Heinonen 288-90 (TUR, det. J. Ruotsalainen 2008).

R. aeruginea Lindblad is a common species growing mainly with *Betula*. However, we have seen also groups of it in forests of *Picea abies*. *R. aeruginea* has not so bright green pileus as *R. graminea*. It has paler spores in mass. Further, spores are smaller, more oblong and with an inamyloid plage, and dermatocystidia are aseptate.

R. luteoviridans C.Martin is a species not well understood. Sarnari (1998) has the name as a synonym (with question mark) under *R. cuprea* Krombh. On the other hand, *R. luteoviridans* C.Martin ss. Blum, with its mild taste and encrusted primordial hyphae, is a species of section Polychromae, subsection Integroidinae (Romagnesi 1967, Einhellinger 1985, Aicher 1996).

The ITS sequences of all the three collections of *R. graminea* studied were identical. In the comparison to Genbank, no close ITS sequences of possible sister species were found using BLAST (differing by less than 20 evolutionary events). As a fairly rare species, growing in older forests of *Picea abies*, *R. graminea* has been classified as a Near Threatened (NT) species in Finland (Bonsdorff et al. 2010).

Acknowledgements: We began the manuscript of the new species *Russula graminea* with Hans-Gunnar Unger†. We appreciate his contribution and dedicate this enigmatic species to his memory. Curators of herbaria H, O, OULU, S and UPS are gratefully acknowledged for arranging loans. We thank all friends for sending their specimens to us. Federico Calledda kindly gave us permission to use his beautiful photograph of *R. graminea* for the article, and Mauro Sarnari sent us important literature. This work was supported by the Ministry of Environment, Finland (YML38/5512/2009). Ernest Emmett is warmly thanked for improving the English.
